CLAIMS

What is claimed is:

1. A spam detection system comprising:

a component that identifies features relating to at least a portion of origination information of a message; and

a component that combines the features into useful pairs for use in connection with training a machine learning filter to facilitate detecting spam.

2. The system of claim 1, wherein each pair comprises at least one of the following:

at least one of a domain name and a host name in a MAIL FROM

command:

at least one of a domain name and a host name in a HELO COMMAND; at least one of an IP address and a subnet in a Received from header; at least one of a domain name and a host name in a Display name; at least one of a domain name and a host name in a Message From line;

and

at least one time zone in a last Received from header.

- 3. The system of claim 2, wherein the domain name is derived from the host name.
- 4. The system of claim 2, wherein the subnet comprises one or more IP addresses that share a first number of bits in common.
- 5. The system of claim 1, wherein a useful pair is any one of a domain name and a host name from a Message From and from a HELO command.
- 6. The system of claim 1, wherein a useful pair is a Display name domain name and host name and a Message From domain name and host name.

- 7. The system of claim 1, wherein a useful pair is any one of a domain name and a host name in a Message From and any one of a Received from IP address and subnet.
- 8. The system of claim 1, wherein a useful pair is a sender's alleged time zone and a Message From domain name.
- 9. The system of claim 1, wherein a useful pair comprises a sender's type of mailing software and any one of a domain name, host name and user name derived from one of an SMTP command and a message header.
- 10. The system of claim 1, wherein origination information comprises SMTP commands, the SMTP commands comprise a HELO command, a MAIL FROM command, and a DATA command.
- 11. The system of claim 10, wherein the DATA command comprises a Message From line, sender's alleged time zone, and sender's mailing software.
- 12. The system of claim 1, further comprising a component that applies one or more heuristics consistently to mail messages to obtain consistent feature pairing.
 - 13. A spam detection system comprising:

a component that analyzes a portion of a message via searching for particular character sequences that are indicative of spam, wherein the particular sequences are not restricted to whole words; and

a component that generates features relating to the character sequences of any length.

14. The system of claim 13, wherein the component generates features for each run of characters up to a maximum character run length.

- 15. The system of claim 13, wherein the component generates features for substantially all character sequences up to some length n.
- 16. The system of claim 13, wherein the character sequences comprise at least one of letters, numbers, punctuation, symbols, and characters of foreign languages.
- 17. The system of claim 13, wherein the particular character sequences comprise at least one of random letters, symbols, and punctuation as chaff at any one of a beginning and end of at least one of a subject line of a message and a message body.
- 18. The system of claim 17, wherein random character sequences comprise character n-grams which are indicative of spam-like messages.
- 19. The system of claim 18, wherein the character n-grams are located in at least one of From address, subject line, text body, html body, and attachments.
- 20. The system of claim 18, wherein the character n-grams are position dependent.
- 21. The system of claim 13 for use with the messages comprising at least one of foreign language text, Unicode character types, and other character types not common to English
- 22. The system of claim 21, wherein the foreign language text comprises substantially non-space separated words.
- 23. The system of claim 22, wherein n-grams are used only for characters not typically separated by spaces.

- 24. The system of claim 13, further comprising a component that extracts character sequences obfuscated by punctuation using a pattern-match technique.
- 25. A spam detection system comprising:
 a component that analyzes a portion of a message via searching for instances of a string of random characters that are indicative of the message being spam.
- 26. The system of claim 25, further comprising a component that generates features corresponding to the instances of random character strings to facilitate determining an entropy measurement for each string.
- 27. The system of claim25, wherein the system measures a value correlated with entropy.
- 28. The system of claim 27, wherein a high value correlated with entropy is indicative of spam.
- 29. The system of claim 28, wherein the value correlated with entropy is the actual entropy -log₂ P(abc...z)
- 30. The system of claim 27, wherein the average entropy of a character string is used.
 - 31. The system of claim 25, wherein the string of random characters is chaff.
- 32. The system of claim 27, wherein the relative entropy compares the entropy measurement at any one of a beginning and end of at least one of a subject line and message body with the entropy measurement at a middle of at least one of the subject line and message body.
 - 33. A spam detection system comprising:

a component that analyzes substantially all features of a message header in connection with training a machine learning spam filter.

- 34. The system of claim 33, wherein the features of the message header comprise at least one of a presence and absence of at least one message header type, the message header types comprising X-Priority, mail software, and headers line for unsubscribing.
- 35. The system of claim 34, wherein the features of the message header further comprise content associated with at least one message header type.
- 36. The system of claim 33, further comprising:
 a component that analyzes at least a portion of a message for images and related image information; and

a component that generates features relating to any one of the images and related image information.

- 37. The system of claim 36, wherein the image information comprises image size, image quantity, location of image, image dimensions, and image type.
- 38. The system of claim 36, wherein the image information comprises the presence of a first URL and a second URL such that the image is inside of a hyperlink.
- 39. The system of claim 38, wherein the message comprises a tag pattern having the form of </A.
- 40. The system of claim 36, wherein the features are used in connection with training a machine learning filter.

- 41. The system of claim 33, further comprising a component that analyzes a message for HTML attributes and location of HTML attributes as they appear in a tag pattern.
- 42. A method that facilitates generating features for use in spam detection comprising:

receiving at least one message;

parsing at least a portion of a message to generate one or more features; combining at least two features into pairs, whereby each pair of features creates at least one additional feature, the features of each pair coinciding with one another; and

using the pairs of features to train a machine learning spam filter.

- 43. The method of claim 42, wherein the at least a portion of the message being parsed corresponds to origination information of the message.
- 44. The method of claim 42, wherein each pair comprises at least one of the following:

at least one of a domain name and a host name in a MAIL FROM command;

at least one of a domain name and a host name in a HELO COMMAND; at least one of an IP address and a subnet in a Received from header; at least one of a domain name and a host name in a Display name; at least one of a domain name and a host name in a Message From line;

and

at least one time zone in a last Received from header.

45. The method of claim 44, wherein the domain name is derived from the host name.

- 46. The method of claim 42, wherein the pair of features is a Display name domain name and host name and a Message From domain name and host name.
- 47. The method of claim 42, wherein a useful pair is any one of a domain name and a host name from a Message From and from a HELO command.
- 48. The method of claim 42, wherein the pair of features is any one of a domain name and a host name in a Message From and any one of a Received from IP address and subnet.
- 49. The method of claim 42, wherein the pair of features is a sender's alleged time zone and a Message From domain name.
- 50. The method of claim 42, wherein the pair of features comprises a sender's type of mailing software and any one of a domain name, host name and display name derived from one of an SMTP command and a message header.
- 51. The method of claim 42, further comprising selecting one or more most useful pairs of features to train the machine learning filter.
- 52. The method of claim 42, further comprising employing the machine learning filter after it is trained to detect spam by performing the following:

receiving new messages;

generating pairs of features based on origination information in the messages;

passing the pairs of features through the machine learning filter; and obtaining a verdict as to whether at least one pair of features indicates that the message is more likely to be spam.

53. A method that facilitates generating features for use in spam detection comprising:

receiving one or more messages;

walking through at least a portion of the message to create features for each run of characters of any run length; and

training a machine learning filter using at least a portion of the created features.

- 54. The method of claim 53, further comprising generating features relating to a position of at least one run of characters.
- 55. The method of claim 54, wherein the position comprises any one of a beginning of a message body, an end of a message body, a middle of a message body, a beginning of a subject line, an end of a subject line, and a middle of a subject line.
- 56. The method of claim 53, wherein the features are created for a run of characters up to length n.
- 57. The method of claim 53, wherein the features are created for sub-lengths of runs of characters.
- 58. The method of claim 53, wherein the run of characters comprise character n-grams.
- 59. The method of claim 53, further comprising calculating an entropy of one or more run of characters and employing the calculated entropy as a feature in connection with training a spam filter.
- 60. The method of claim 59, wherein the entropy is at least one of high entropy, average entropy, and relative entropy.
- 61. The method of claim 60, wherein the average entropy is the entropy per character of a particular run of characters.

- 62. The method of claim 60, wherein the relative entropy is a comparison of the entropy of a particular run of characters at a first location relative to the entropy of a particular run of characters at a second location of the message.
- 63. The method of claim 62, wherein the first and second locations comprise a beginning of a subject line, a middle of a subject line, and an end of a subject line, whereby the first location is not the same as the second location when determining the relative entropy for any given run of characters.
- 64. The method of claim 62, wherein the first and second locations comprise a beginning of a message, a middle of a message, and an end of a message, whereby the first location is not the same as the second location when determining the relative entropy for any given run of characters.
- 65. The method of claim 53, further comprising employing the machine learning filter after it is trained to detect spam by performing the following: receiving new messages;

generating features based at least one of runs of characters and entropy determinations of runs of characters in the messages:

passing the features through the machine learning filter; and obtaining a verdict as to whether the features indicate that the message is more likely to be spam.

66: A method that facilitates generating features for use in spam detection comprising:

receiving one or more messages; analyzing substantially all features of a message header; and training a machine learning filter using the analyzed features.

- 67. The method of claim 66, further comprising analyzing substantially all features based on image information in the message.
 - 68. A computer readable medium comprising the method of claim 42.
 - 69. A computer readable medium comprising the method of claim 53.
- 70. A computer-readable medium having stored thereon the following computer executable components:

a component that identifies features relating to at least a portion of origination information of a message; and

a component that combines the features into useful pairs for use in connection with training a machine learning filter to facilitate detecting spam.

71. The computer readable medium of claim 70, further comprising:
a component that analyzes a portion of a message via searching for
particular character sequences that are indicative of spam, wherein the particular
sequences are not restricted to whole words; and

a component that generates features relating to the character sequences of any length.

- 72. The computer readable medium of claim 70, further comprising:
 a component that analyzes a portion of a message via searching for instances of a string of random characters that are indicative of the message being spam.
- 73. A system that facilitates generating features for use in spam detection comprising:

a means for receiving at least one message;

a means for parsing at least a portion of a message to generate one or more features;

- MS303962.1

a means for combining at least two features into pairs, whereby each pair of features creates at least one additional feature, the features of each pair coinciding with one another; and

a means for using the pairs of features to train a machine learning spam filter.

74. A system that facilitates generating features for use in spam detection comprising:

a means for receiving one or more messages;

a means for walking through at least a portion of the message to create features for each run of characters of any run length; and

a means for training a machine learning filter using at least a portion of the created features.

75. The system of claim 74, further comprising calculating an entropy of one or more run of characters and employing the calculated entropy as a feature in connection with training a spam filter.
